                                                                                       Ω
                                                                                                                                           ò
                                                                                                                                                                                                                                                                                            The present invention relates to a method for simultaneous heterologous expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified only one expression and purification need to be employed in order to produce two separately-useful proteins. The present sequence is a DNA encoding Neisseria meningitidis (serogroup B, strain 2996) delta G741-983

```
Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences AAS43808-AAS43805 represent DNA molecules encoding Neisserial proteins and peptide reqions of proteins of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for simultaneous heterologous expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified only one expression and purification need to be employed in order to produce two separately-useful proteins. The present sequence is a DNA encoding Neisseria meningitidis (serogroup B, strain 2996) 961c-983 fusion

Neisseria meningitidis fusion protein delta-G983-741 DNA.

```
The invention relates to methods for the heterologous expression of Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences AAS43868-AAS43905 represent DNA molecules encoding Neisserial proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  522
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified-only one expression purification need to be employed in order to produce two separately-useful proteins. The present sequence is a DNA encoding Neisseria meningitidis (serogroup B, strain 2996) delta G983-741
                                                                                                                                                                                                                                                                                                                                                                                                                                                   ACTICIGCGCCCGACTICAAIGCAGGCGGCACCGGIAICGGCAGCAACACAGCAGCAACA 162

The invention relates to methods for the heterologous expression of Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences AAS43868-AAS43005 represent DNA molecules encoding Neisserial proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ä
                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for simultaneous heterologous expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified-only one expression and purification need to be employed in order to produce two separately-

                                                                                                                                                                                                                                                                                                                                                   1;
                                                                                                                                                                              The invention relates to methods for the heterologous expression of beisserial proteins from Neisseria meningitidis and Neisseria of protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF6.1, 287, 741, 919, 953, 961 and 983. Sequences AAS43668-AAS43905 represent DNA molecules encoding Neisserial proteins and peptide regions of the invention.
                                                                                                                                                                                                                                                                                                                                                                         162

AAS43868-AAS43905 represent DNA molecules encoding Neisserial prot and peptide regions of proteins of the invention. Sequence 4425 BP; 1165 A; 1259 C; 1219 G; 782 T; 0 other; ery Match 92.8%; Score 2971.8; DB 22; Length 4425; Et Local Similarity 97.2%; Pred. No. 0; tches 3052; Conservaty 97.2%; Pred. No. 0; tches 3052; Conservaty 97.2%; Pred. No. 0;	ACTTCTGCGCCCGACTTCAATGCAGGCGGCACCGGTATCGGCAGCACACAGCAGGAGCAACAGCAACAGCAGCAACAGCAG	163 ACAGCGAAATCAGCAGCAGTATCTTACGCCGGTATCAAGAACGAAATGTGCAAAGACAGA	223 AGCATGCTCTGTGCCGGTCGGGATGACGTTGCGGTTACAGACAG	283 GCCCCCCCCCGGATCTGCATACCGGAGACTTTACAAACCCAAATGACGCATACAAGAAT 	343 TTGATCAACCTCAAACCTGCAATTGAAGCAGGCTATACAGGACGCGGGGTAGAGGTAGGT	403 ATCGTCGATACAGGCGAATCCGTCGGCAGCATATCCTTTCCCGAACTGTATGGCAGAAAA	463 GAACACGGCTATAACGAAAATTACAAAACTATACGCGGTATATGCGGAAGGAA	523 GAAGACGGAGGCGGTAAAGACTTAAAGCTTCTTTCGACGATGAGGCCGTTATAGAGACT	583 GAAGCAAAGCCGACGGATATCCGCCACGTAAAAGAAATCGGACACATCGATGTGGTCCTCC	643 CATATTATTGCCGGCGTTCCGTGGACGGCAGACCTGCAGGCGGTATTGCGCCCGATGCG	703 ACGCTACACATAATGAATACGCATGATGGAACCAAGAACGAATAATGTCTGCAGCCATC	763 CGCAATGCATGGTCAAGCTGGGCGAACGTGGCGTGCGCATCGTCAATAACAGTTTTGGA	923 ACAACATCGAGGCAGGCACCACCATTTCCAAATAGCCAATTCGGAGGAGGAGGAGTAC	883 CGCCAAGCGTTGCTCGCCTATTCCGGCGGTGATAAAACAGACGAGGGTATCCGCCTGATG 	943 CAACAGAGGATTACGGCAACTTGTCCTACCACATCCGTAATAAAAACATGCTTTTCATT 	1003 TTTTCGGCAAGCAATGACGCACAAGCTCAGCCCAACACACAC

expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified-only one expression and purification need to be employed in order to produce two separately useful proteins. The present sequence is a DNA encoding Neisseria meninglitidis (serogroup B, strain 2996) delta G983-ORF46.1 (open reading frame) fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for simultaneous heterologous

The present invention relates to a method for simultaneous heterologous expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A mottein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified only one expression and purification need to be employed in order to produce two separately useful proteins. The present sequence is a DNA encoding Neisseria meningitidis (serogroup B, strain 2996) delta G983-961
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     342

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                               AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1959

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;
                                                                                                                                                                                                                                                                                                                              AAE53015 to AAE54536, AAE54577 to AAE54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAE5457 to AAE54576 and AAE54616 to AAE55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used in gene therapy protocols.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAE53015 to AAE54536, AAE54577 to AAE54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAE54571 to AAE54576 and AAE54616 to AAE55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAE53015 to AAE54536, AAE54577 to AAE54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAE54577 to AAE5456 and AAE54616 to AAE55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The Polynucleotides of the invention may also be used in gene therapy protocols.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4
                                                                                                                                                                                                                                    AA253015 to AA254536, AA254577 to AA254615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AA254577 to AA254576 and AA254616 to AA255473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also
                                                                      Masignani V, Mora M;
Scalato E, Scarselli M;
                                                                                                                                                                                                                                                                                                                                                                                   be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 416

represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ4577 to AAZ4576 and AAZ4616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise autibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      4

AAV03575-606 represent sequences that are present in Neisseria meningitidis and N. gonorrheae but not in N. lactamica, except for the genes involved in biosynthesis of the capsule polysaccharide, frpA or C, poc, porA, rotamase, sequence 1Cl106, IgA protease, pillin, pilC, proteins which bind transferrin and opacity proteins. The DNA sequences are responsible for the differences in pathogenicity between N. meningitidis and N. gonorrheae, specifically they include the genes that allow N. meningitidis to cross the blood-brain barrier. DNA sequences common to N. meningitidis and N. gonorrheae, but absent from N. lactamica, are responsible for colonisation and penetration of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1044 GACCCTATTGCCATTTTATGAAAAAGATGCTCAAAAAGGCATTATCACAGTCGCAGGCGT 1103
                                                                                                                                                                                                                                                                       mucosa. The DNA sequences can be used to produce probes and primers, a antibodies produced against the encoded proteins are used in standard hybridisation/immunoassay processes for diagnosis of N. meningitidis infection, particularly meningitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAAAACATGCTTTTCATTTTTCGGCAAGCAATGACGCACAAGCTCAGCCCAACACACT 1043

                                                                                                                                                                                                                                         ä
         New polypeptide specific for pathogenic Neisseria useful in therapeutic or preventative vaccines and for diagnosis
                                                            The present sequence represents a genomic fragment of Neisseria meningitidis. The specificatino describes proteins that are specific for pathogenic strains of Neisseria. The polynucleotides, polypeptides, or their antigenic fragments, are used in vaccines to treat or protect against Neisseria infections, particularly by N. meningitidis. The polynucleotide sequences are also used for recombinant production of the polypeptide and to produce attenuated Neisseria strains that oversepress it, or express it in a non-toxic mutant form.

oversepress it, or express it included in Claim 1, but it is those sequences that do not include the present sequence that are actually
                                                                                                                                                                                                                                                                                                                                                  985 AAAAACAIGCIITITCAIITITICGGCAAGCAAIGACGCACAAGCICCAGCCCAACAC-ACI 1043

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA81214 claimed Neisseria meningitidis genomic DNA cepresent specifically claimed Neisseria meningitidis peromic DNA sequences; AAA81260 to AAA81303 and AAA81304 to AAA81312 represent PCR primers used in the candingitidis DNA sequences; and AAA81324 to AAA81452 and AAA81312 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis DNA sequences, and antibodies composition of Neisseria meningitidis MenB polynucleotide ORF CC GAA81452 represent Neisseria meningitidis MenB polynucleotide ORF CC GAA81452 represent Neisseria meningitidis MenB polynucleotide ORF CC GAA81452 represent Neisseria meningitidis Meningococcus and antibodies against them, can be used in the manufacture of a composition of botogical present CC Composition Comboners of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neisseriae. Identification of sequences from the bacterium Will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have also been tried but none have successfully overcome antiqenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and external provision of least more conserved than are not antigenically variable or at least more conserved than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Neisseria meningitidis; Neisseria gonorrheae; genome; immunogenic; antigen; vaccine; diagnosis; infection; antibacterial; identification; Meningococcus B; MenB; ds.

Cr proteins from Neisseria genomic sequences. AAA81453 to AAA82414

Cr proteins from Neisseria genomic sequences. AAA814563 represent by sequences, AAA812660 to AAB25663 represent by sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA81304 to AAA81321 represent PCR primers used in the isolation of Neisseria meningitidis Mens polynucleotide ORF capabatis represent Neisseria meningitidis Mens polynucleotide ORF capabates them, can be used in the manufacture of a composition. The composition can be used in the manufacture of a composition can be used a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition of variant all also facilitate production of biological probes; and/or against all pathogenic Neissariae. Identification of sequences for multivalent vaccines have failed mainly due to antigen tolerance. Which manufacture or surface conserved than any provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and the manufacture or at least more conserved than other more variable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a gene encoding a subunit of the cellulose synthase complex of Vigna angularis. The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2807

The present sequence encodes a specifically claimed M.tuberculosis antigen, TbRa32. The immunogenic protein, and fusion proteins containing one or more of the proteins or one of the proteins plus ESAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against

         modifications). The present sequence encodes a specifically claimed M.tuberculosis antigen, TbRa32. The immunogenic polypeptide can be used to diagnose M.tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies

This sequence encodes an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                        2065 GCGGCACATTCCGCGCCGCCGCCGTCTGAAACACGCCGTAGAACAGGGCGGCAGCAATCTG 2124

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                   against M. tuberculosis superinstant. No significant homology was found between robasis augernation. No significant homology was found between robasis and Genebank database sequences. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAMG4291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using the above polypeptides, antibodies, or oligonucleotide probes and primers, for the diagnosis of
New isolated Mycobacterium tuberculosis polypeptides and DNA - used to develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mycobacterium tuberculosis; M. tuberculosis; antigen; immunogen; immunotherapy; diagnosis; immunisation; vaccine; infection;

The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's.

M. tuberculosis Ag's, DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis, ag can induce proliferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ŏ
                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                   This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunitaring against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity.

The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, why obsercerium therculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AA199683) and H37Rv (AA199682). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Db 336988 CGCTGCCGCCGCTGCCGCCGCCGCCGCGGGGCGCGAGGGCGAGTAGGCCGGCGTTGC 337047

                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the sequences of M. tuberculosis strains CDC 1551 (AAI99683) and H37Rv (AAI99682). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=6294328B1.

The invention describes a method of monitoring differential expression of genes in a first Bacillus cell relative to expression of the genes in other Bacillus cells, comprising hybridising labelled nucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus genomic sequenced tags (GST), examining the array, and determining relative gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cell relative to expression of the same genes in one or more second Bacillus cells. The method is useful for monitoring new global expression of several genes from a Bacillus cell, discovering new global expression of several genes from a Stability. Monitoring changes con next to expression of genes may be used to provide a representation of the way in which Bacillus cells adapt to changes in culture conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     environmental stress or other physiological provocation. Extensive follow-up characterisation is unnecessary, when one spot on an array equals one gene or one open reading frame, since sequence information is available. This sequence represents a genomic sequence tag (GST) used in the method of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AA199683) and H37Rv (AA199682). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 4403765 BP; 757105 A; 1447799 C; 1441301 G; 757371 T; 189 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=6294328B1.

TITLE OF INVENTION: DNA, specific proteins and peptides
TITLE OF INVENTION: of the Neisseria meningitidis species bacteria, method
TITLE OF INVENTION: of the Neisseria meningitidis species bacteria, method
TITLE OF INVENTION: for obtaining them and their biological application.
NUMBER OF SEQUENCES: 99
